## PREFACE

SABIR2, the program recently completed by Mrs. Haworth, has facilitated a vitally-important service that is now available to patrons of the U. S. Naval Postgraduate School Library. This service, a sophisticated machine information storage and retrieval system, provides one of the few feasible solutions to a problem that plagues scientific communities throughout the United States. The problem can best be described as the determination of the modus operandi by which information on a specific subject or a group of subjects can be most easily, accurately, and expeditiously obtained. The simplicity of this definition is perhaps misleading, for today an ever-increasing volume of technical documents issued by industrial companies and federal facilities has made information retrieval a matter of critical concern to scientists, librarians, and information specialists. Most certainly, the Postgraduate School Library has felt the impact generated by the current population explosion of scientific and technical publications.

In terms of its practical application, Mrs. Haworth's program now makes it possible for the Technical Reports and Classified Material Section of the Library to provide a bibliography of technical reports suited to almost any particular research requirement. The requests of students and faculty members for such lists will be processed on input paper tape which will be taken to the Computer Facility. Through the utilization of the CDC 1604, thousands of records stored on magnetic tape files will be searched in a matter of minutes. The printed output will itemize those

documents selected during the course of a search run. The itemization will be in bibliographical format, citing corporate authors (sources), titles, personal authors, dates and other related data, and, in addition, many citations will also carry abstracts. Fifty searches may be run simultaneously with no additional time cost. Since the demands upon the Technical Reports Section grow heavier each year, the value of this particular program is evident.

The desirability of an automated information retrieval system was recognized by the Librarian, Professor George R. Luckett, during the nineteen-fifties. At that time the only available subject approach to the Library's technical documents was through the medium of the coordinate index, a manual tool that was both impractical and unwieldy when used for the control of a large number of documents. It was soon apparent that the ultimate answer could be found only through the utilization of automation.

In 1960, Lt. Martin A. Wildberger, a student in the Department of Mathematics and Mechanics, studied the problem of subject access to the Library's technical documents and subsequently wrote SABIRS, the foundation program, as the subject of his Master's Thesis. The service that it made possible was initiated in August, 1961. SABIRS was a valuable first step as it eliminated absolute dependence upon the coordinate index and effected a transition from manual to automated searching. It was limited, however, to the extent that a search output revealed only the accession (control) numbers of the items cited. Consequently, patrons were compelled to check each number against a corresponding number in the catalog shelf list. This

proved to be in many cases a tedious step which detracted from the usefulness of the system. Therefore, in April, 1963, the Computer Facility was requested to provide the programming effort necessary to add abstracts or bibliographic information to the search output and to arrange this output so that each requestor's bibliography was separate from the others found in the same run. These goals have now been elegantly attained. In the process Mrs. Haworth has recorded the entire system and has added various other improvements which will be described in the text of her report.

During the six months that followed the implementation of SABIRS a total of 150 searches were run. Utilization of the system has increased to the point where 2,000 searches per year are now being made. With the introduction of SABIR2, it is anticipated that within eighteen months the number of searches will average 5,000 annually.

Paul Spinks  
Associate Librarian  
Associate Professor

## INTRODUCTION

The background material necessary to a full understanding of the information retrieval system described in this paper is given in the Wildberger Thesis (Reference 1). Pages 38-40 of that thesis explain the problem to be solved. Briefly, the Technical Reports Section of the U. S. Naval Postgraduate School Library contains more than 150,000 items and grows at the rate of about 5,000 per year. The items, varying in size from thin pamphlets to folios, are stored in cabinets, shelved individually, or packed in shelf boxes. More than 60,000 are classified confidential or higher and must be stored according to the appropriate regulations. The reports contain scientific or engineering information and originate from government agencies, academic institutions or private companies. A method was needed to enable students and research workers to retrieve the particular information they want from this mass of material.

Pages 41-45 of Reference 1 explain that under SABIRS, requestors specified the sort of technical reports desired by "uniterms" with or without originating agency and/or range of publication dates. A "uniterm" is a descriptive term denoting a technical subject. Each permitted uniterm and each originator has been assigned a numerical code. This same scheme is used in SABIR2.

The program searches the document files of reports to find those which satisfy the requests. Then the resulting information is output in an intelligible format. Various auxiliary programs are necessary to do this basic search task. The most important of these is the update program which

deletes documents from the appropriate tape files when items are discarded in the Library and adds information to the files when items are added to the Library. All of the major and auxiliary programs will be explained in detail in this paper.

In converting from SABIRS to SABIR2, the first change desired by the Library was the inclusion of abstract or bibliographic information in the system. To accomplish this a file of that data was generated by using the paper tapes derived as a by-product when library personnel typed bibliographic cards on a flexowriter. The data on these tapes were edited and written on magnetic tape in ascending order by accession number.

The coded document file already in existence was also reordered by ascending accession number. With both files ordered the same way, bibliographic information would be easily available. It would also be possible to include checking procedures to be certain all information was present when needed. Finally by having two files on different channels all tape input-output could be overlapped with considerable saving in machine time.

The program in its final form can be operated on multi-reel files, though at present each file is less than one reel in length. Paper tape requests for search are accepted in the same format as previously. Results are sorted so that each requestors answers are printed separately.

The update program accepts paper tape input requests for adding-to, replacing or deleting-from both files. The information necessary for updating the coded document file is in the same format as before. The information necessary to update the new bibliographic file can be any

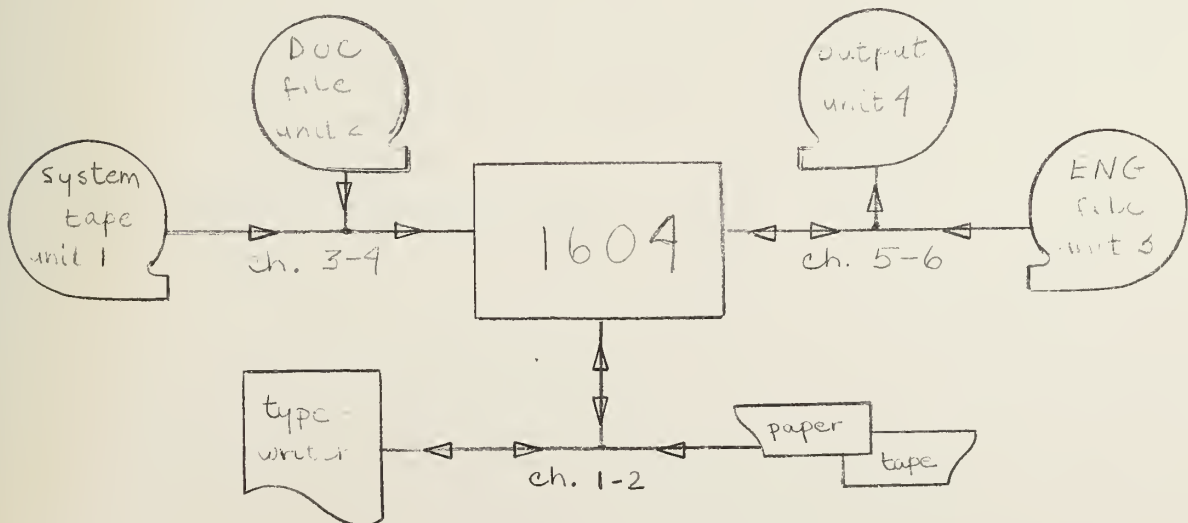

alphanumeric description identified by an accession number and not exceeding 600 characters.

The system also contains a small Master Control Program which governs reading in the programs to be executed. The details of each of these subprograms are discussed below. Familiarity with the Control Data Corporation 1604 Computer is assumed. (See Reference 2)

The Master Control Portion: Communicates with machine operator to get date and option whether to search or update. It reads in the appropriate program, which is then executed.

The SEARCH Portion: The SEARCH program accepts paper tape (a flexowriter or synchrotape) input on which are punched the requests (an identifier followed by uniterms or keywords). After reading in all the requests (up to 50), the program searches the DOC magnetic tapes for bulletins which have all the desired uniterms (Reference 1, page 55). When a document satisfies a request, its bibliography or abstract is found on the ENG tapes and printed as output for the request.

A system schematic of SEARCH portion:

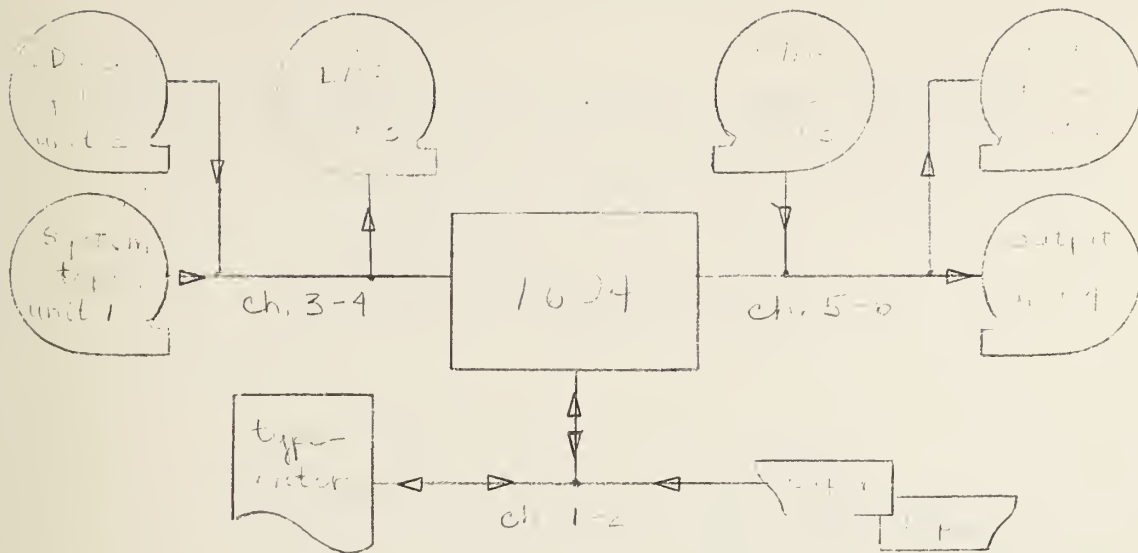

1. System tape (unit 1, channel 3): contains a control program, the search program and the update program (see Appendix 3).
2. DOC File (unit 2, channel 3): contains document number (accession number) followed by source, date and uniterm codes. These are arranged in ascending order of document number (see Appendix 3).
3. ENGLISH title file (unit 3, channel 5): contains in the first word, the number of words in the record, the rest of the record is the bibliography card information or an abstract. All records are in ascending order of document number. (Maximum of 83 words per records). (See Appendix 3).
4. Output tape (unit 4, channel 6). contains
  - a. List of requests on first page.
  - b. Followed by pages of output for each person. First line of each page has person identifier and page number of output with respect to them.

The UPDATE Portion: The UPDATE portion reads in the paper tapes which contain update information for the DOC tapes or ENG tapes or information to be deleted from both. The program then reads in the old DOC and ENG tapes creating new updated versions with all documents arranged in ascending order. The print output tape will contain a list of all additions and deletions for the run.

A system schematic of UPDATE portion:

1. System tape (unit 1, channel 3): same as for search.
2. DOC tape (unit 2, channel 3): the old version of DOC which is to be updated (see Appendix 3).
3. New ENG tape (unit 3, channel 4): the new updated ENG tape at the end of the run.
4. ENG tape (unit 3, channel 5): the old ENG which is to be updated (see Appendix 3).
5. New DOC tape (unit 2, Channel 6): New updated DOC tape.
6. Output (unit 4, channel 6): list of additions and deletions made.

## OPERATING INSTRUCTIONS

### I. Writing the system tape (see Appendix 3 under system tape)

- A. Place the system deck on magnetic tape on unit 1, Ch. 5-6  
(use 1401 program A1:CT 01)
- B. Place system tape on unit 1, Ch. 3-4
- C. Bootstrap

10 in A reg. right

200 00005 in FC and EA --- STEP

740 52011 in FC and EA --- STEP

745 00000 in FC and EA --- STEP

--- CLEAR

put 00006 in PAR --- START

Computer will halt with 760 77733 in FC and EA and 77733 in PAR

- D. A new SABIR2 system tape will be on unit 1, Ch. 3-4
- E. Error stops:

<u>PAR</u>	<u>REASON</u>
77563	Checksum error--press start to try again.
77601	Tape read error unit 1, Ch. 5. Press start to retry.
77747	Tape write error unit 1, Ch. 4. Press start to retry.

## II. Running the SABIR2 System for SEARCHING

### A. Loading the system tape

1. Mount the SABIR2 system tape on unit 1, Ch. 3-4.
2. Bootstrap the system tape as follows

CLEAR and STEP

Place 00270 in A Reg. right

200 00003 in FC and EA --- STEP

740 32011 in FC and EA --- STEP

743 00030 in FC and EA --- STEP

--- CLEAR

Place 00030 in PAR --- START

(this reads in MC prog.)

### B. Mount tapes

1. Current ENG 01 on unit 3, Ch. 5-6
2. Current DOC 01 on unit 2, Ch. 3-4
3. Scratch tape for output on unit 4, Ch. 5-6

### C. Communicate with MC (Master Control)

1. The program will type:

"date;"

2. Operator should type in

mm/dd/yy

where mm = month

dd = day

yy = year

- a. If the operator types an illegal character the program will type "illegal" and expect the operator to start typing again.
  - b. If the operator wishes to restart, he should type CR (carriage return) and the program will be ready to accept new typed input, disregarding the old.
  3. The program will type:  
"option;"
  4. Operator should type in  
search.
    - a. Error procedures of 2a. and b. above apply here also.
  5. The computer will halt with 00065 in the PAR, ready to execute the SEARCH when START is pressed.
- D. Reading in the Search Inputs
1. Set jump key 1 off
  2. Set paper tape reader for 7th level tapes
  3. Place request paper tape in paper tape reader in character mode. If it is the last paper tape to be read in, set jump key 1 on (up), press START.
  4. After each paper tape, except the last, has been read in, the computer will halt with <sup>54154</sup>~~04147~~ in the PAR.
  5. Put the next paper tape in the reader, set jump key 1 on if last tape and press START.

6. After the last paper tape has been read or 50 requests assembled, the SEARCH will commence.

E. Messages on typewriter during Search Input phase

<u>MESSAGE</u>	<u>MEANING + ACTION</u>
MODE	Means the paper tape reader is not in the character mode. Put it in the character mode and press START.
50 REQST	Fifty input requests have been read in, no more can be handled this run. Leave the paper tape reader as it is. At the end of this search the program will read in the rest of the requests and do another search.

F. During the Search

1. Both tape 2, Ch. 3 and tape 3, Ch. 5 will be read and at intervals answers will be placed on tape 4, Ch. 6.
2. At the end the search run if there are more input tapes (i.e. search was started by 50 REQST), "MORE SEARCHING IS NECESSARY, MOUNT DOC01 AND ENG01, PRESS START" will type.
  - a. Ready DOC01 and ENG01 on units 2, Ch. 3 and 3, Ch. 5, respectively, and press START.
  - b. The program will continue from step D4.
3. If there is no more searching to be done, "END OF SEARCH." is typed and control goes to MC program.

G. Terminating the search or starting another.

1. MC types "option;" and the operator may do one of the following

- a. Do more searching and precede as in C3.
- b. Initiate an UPDATE and precede as described in UPDATE operating instructions, III C3.
- c. Terminate the run by typing

END.

which will cause "END OF TAPE" to be written on the output tape 8, unit 4, Ch. 5-6 and will rewind it.

H. Typewriter messages during actual searching

<u>MESSAGE</u>	<u>MEANING + ACTION</u>
TAPE n	Tape error in reading or writing on tape unit n. Press start to retry reading or writing, except for TAPE 8 which proceeds without correcting.
NO REQUESTS	During the input phase, no correct requests were sensed. The search will be terminated.
IF NO MORE DOC PUT SW 3 UP, OTHERWISE MOUNT TP DOC xx ON UNIT 2 CH. 3. START.	The end of the present DOC tape has been reached. If there is a current DOC TP #xx, mount it on unit 2, Ch. 3; set jump key 3 down and press start. If there is no DOC xx, put jump key 3 up and press start.

MESSAGE

MEANING + ACTION

IF NO MORE ENG  
PUT SW 3 UP,  
OTHERWISE MOUNT  
TP ENG xx ON  
UNIT 3 CH. 5.  
START.

The end of the present ENG tape has  
been reached. If there is a current  
ENG xx tape, mount it on unit 3, Ch. 5,  
jump key 3 down, press START. If there  
is no ENG xx, set jump key 3 up and press  
START.

M. ERROR

Incorrectable machine or tape error.  
Run will be terminated. Examine labels on  
DOC and ENG tapes -- if they are okay the  
machine is in error.

TOO MANY

Over 99 ENG or DOC tapes, too many. Run  
terminated.

### III. Running the SABIR2 System for UPDATING

#### A. Loading the system tape

1. Mount the SABIR2 system tape on unit 1, Ch. 3-4.
2. Bootstrap the system tape as follows

CLEAR and STEP

Place 00270 in A Reg. right

200 00003 in FC and EA --- STEP

740 32011 in FC and EA --- STEP

743 00030 in FC and EA --- STEP

--- CLEAR

place 00030 in PAR --- START

(This reads in MC program).

#### B. Mount tapes

1. Current ENG01 on unit 3, Ch. 5-6
2. Current DOC01 on unit 2, Ch. 3-4
3. Free ENG01 on unit 3, Ch. 3-4
4. Free DOC01 on unit 2, Ch. 5-6
5. Scratch tape for output on unit 4, Ch. 5-6.

#### C. Communicate with MC (Master Control)

1. The program will type:

"date;"

2. Operator should type in

mm/dd/yy

where mm = month

dd = day

yy = year

a. In case of trouble or error see section II C 2a.

and b. under operating SEARCH.

3. The program will type:

"option,"

4. Operator should type

UPDATE

a. Typing error procedure is the same as section II C

2a. and b.

5. The computer will halt with 00102 in the PAR, ready to start the UPDATE when START is pressed.

D. Reading UPDATE inputs on paper tape

1. When the last paper tape to be read is in the paper tape reader, put jump key 1 up. Otherwise it must be down.

2. Place the paper tape in the tape reader (7th level mode) in character mode. If it is to update ENG tapes, put jump key 2 up; if it is a delete or to update DOC tape, put jump key 2 down. Press START.

3. After each input tape, except the last, the computer will halt with <sup>01042</sup>~~01034~~ in the PAR.

4. Proceed from step D2.

5. After the last tape or 250 inputs of one type, the actual updating will begin (see section F).

E. Messages on typewriter during UPDATE input phase.

MESSAGE

MEANING + ACTION

MODE

The paper tape reader is not in the character mode. Put it in the character mode and press START.

FULL

One of the input buffers is full i.e. 250 deletes, DOC updates or ENG updates have been read in. The program will now start updating. In order to process the rest of the paper tape in the reader, it must be read on another update run.

F. During the Update

1. If there are ENG updates to be done the current ENG magnetic tape will be read in from unit 3, Ch. 5-6 and updated on unit 3, Ch. 3-4.
2. If there are DOC updates to be done the current DOC magnetic tape on unit 2, Ch. 3-4 will be read in and updated on unit 2, Ch. 5-6.
3. If there are deletions to be done both the current ENG (unit 3, Ch. 5-6) and the current DOC (unit 2, Ch. 3-4) magnetic tapes will be read in and cause new updated versions on unit 3, Ch. 3-4 and unit 2, Ch. 5-6 respectively.
4. An output listing of the updating will be written on unit 4, Ch. 5-6.

5. At the termination of the run, control goes to MC program  
(see section H).

G. After the completion of Updating

1. All ENG tapes generated on unit 3, Ch. 3-4 should be labeled "Current ENG xx", where xx runs consecutively from 01 in the order in which the tapes are generated.
2. The previous "Current ENG xx" (unit 3, Ch. 5-6) should be labeled "Prior ENG xx", where xx is the same number the tape had when it was current.
3. The "Prior ENG xx" becomes Free ENG.
4. All DOC tapes generated on unit 2, Ch. 5-6 should be labeled "Current DOC xx".
5. The previous Current DOC xx (unit 2, Ch. 3-4) should be labeled "Prior DOC xx".
6. The prior DOC xx should be labeled Free DOC.

H. Control returns to MC and the operator may do one of the following

1. Initiate a SEARCH by proceeding as described in II B and omitting steps II C 1 and 2.
2. Initiate another UPDATE by proceeding as described III B and omitting steps III C 1 and 2.
3. Terminate the run by typing

END.

which will cause "END OF TAPE" to be written on the output tape 8, unit 4, Ch. 5-6 and will rewind it.

# I. Typewriter Messages during updating

<u>MESSAGE</u>	<u>MEANING + ACTION</u>
TAPE n	Tape error in reading or writing on logical tape unit n. Press start to retry except for TAPE 8 which proceeds without correcting.
IF NO MORE DOC SW 3 UP, OTHER- WISE MOUNT TP DOC xx ON UNIT 2, CH. 3. START	End of file on Current DOC input tape. If there's a Current DOC xx mount it, put jump key 3 down, and press START. If no more Current DOC tapes put jump key 3 up, press START.
WRONG TAP	Wrong DOC or ENG tape mounted, the number xx does not agree with the number typed above.
LOAD NEW TP FOR ENG xx ON UNIT 3, CH. 4.	End-of-output tape for ENG on unit 3, Ch. 4. Label and save the tape and mount a new Free tape for the next ENG tape.
LOAD NEW TP FOR DOC xx ON UNIT 2, CH. 6.	End-of-output tape for DOC on unit 2, Ch. 6. Label and save present tape and mount a new Free tape for the next DOC tape.
TOO MANY	Tape number for DOC or ENG exceeds 99. Program run terminated.
IF NO MORE ENG PUT SW 3 UP, OTHERWISE MOUNT TP ENG xx ON UNIT 3, CH. 5. START	End of file on ENG input tape unit 3, Ch. 5. If there is an ENG tape numbered xx mount it and put jump key 3 down, press START. If no ENG xx, put jump key 3 up. Press START.

## SABIR2 - Master Control Program

I. FUNCTION - The function of the master control program is to communicate with the 1604 operator and read in the program from the system tape which meets the option the operator has selected.

### II. Communication Procedure

#### A. Initially

"date;" is typed and the program waits for the operator to type in the date in the following form:

mm/dd/yy

where mm = 2 digit number specifying the month

dd = 2 digit number specifying the day

yy = 2 digit number specifying the year

#### B. Next the program types

"option;" and waits for the operator to type in SEARCH.  
or UPDATE., or END.

#### C. Error Procedures

1. If the operator types an illegal character the program will type ILLEGAL and wait for the operator to restart typing message or date.

2. If the operator does a carriage return the program will wait for her to restart typing the message or date.

#### D. Legal Characters which are acceptable as type writer input.

0	S
1	E
2	A
3	R
4	C
5	H
6	U
7	P
8	D
9	T
/	.
CR	N

### III. Option selected

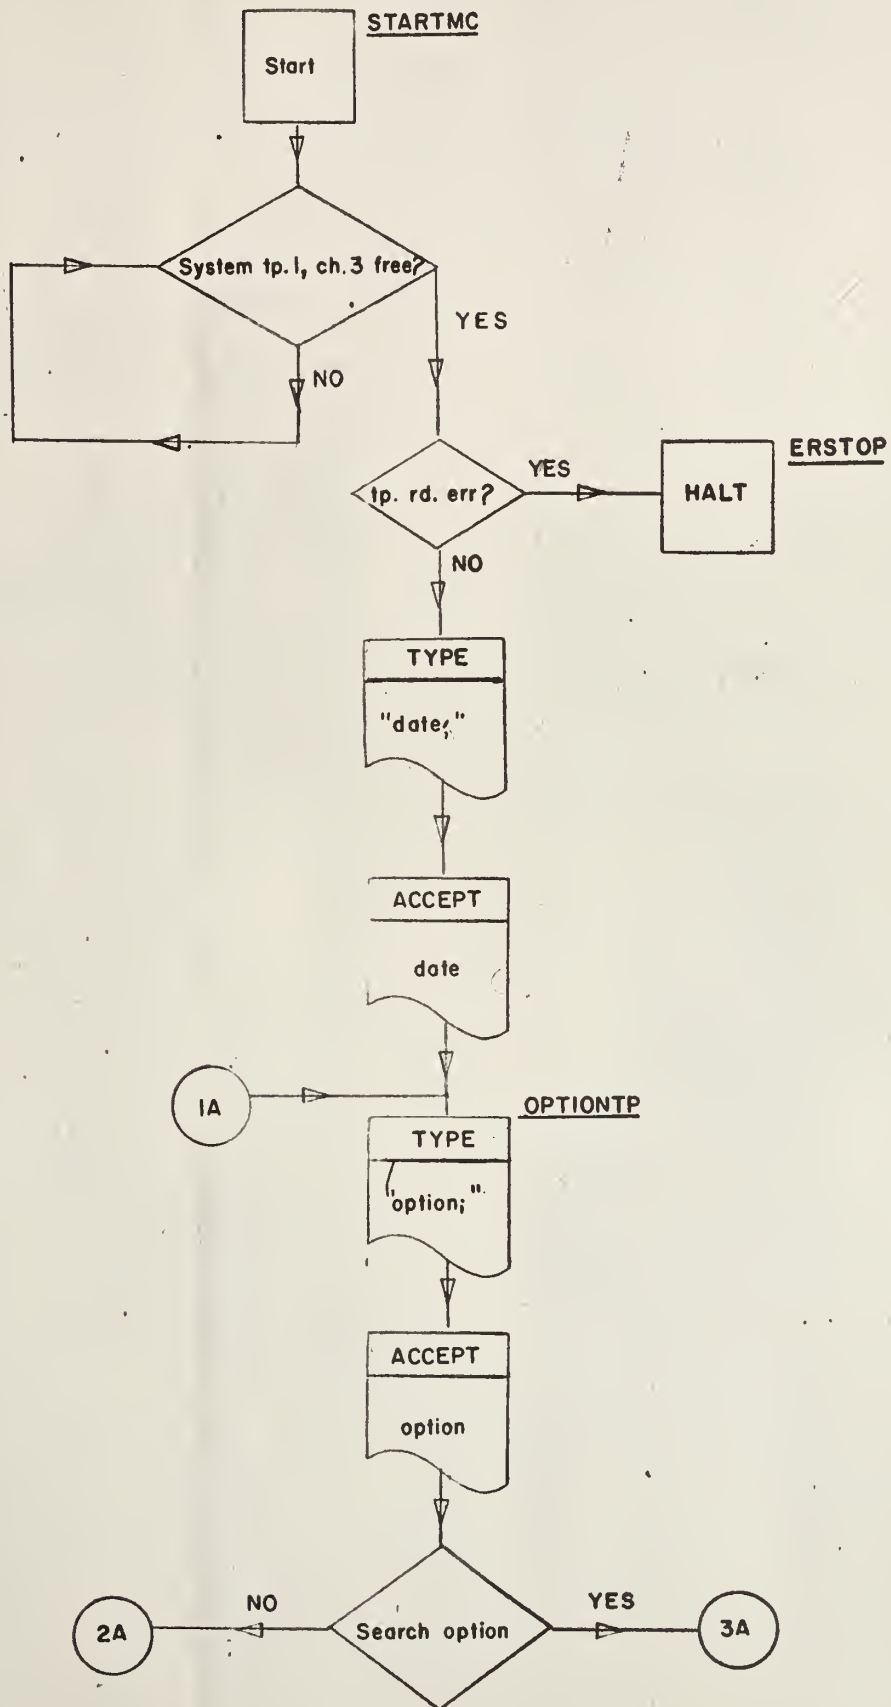

- A. If the SEARCH option was selected, master control reads in the SEARCH - part 1 (SABIR2S1) program and gives control to it.
  1. SABIR2S1 will in turn read in SABIR2S2 when it is needed.
  2. At the end of a SEARCH run, control returns to master control.
- B. If the UPDATE option was selected, master control reads in the UPDATE program from the system tape and transfers control to it.
- C. If the END option was selected, the output tape was ended by "END of TAPE" and rewound. The computer halts. Pressing start transfers control to the option or II B.

### IV. After a run

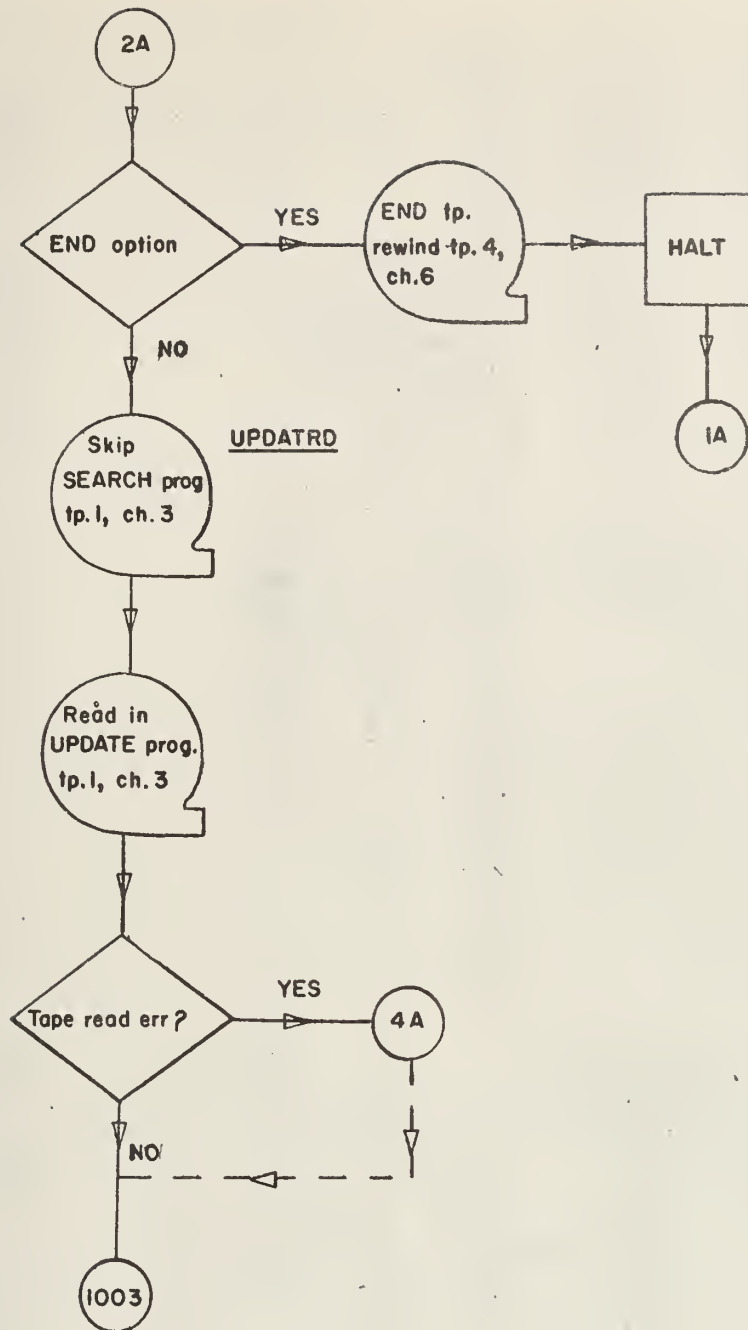

Control is returned to master control and it proceeds as described in section II B.

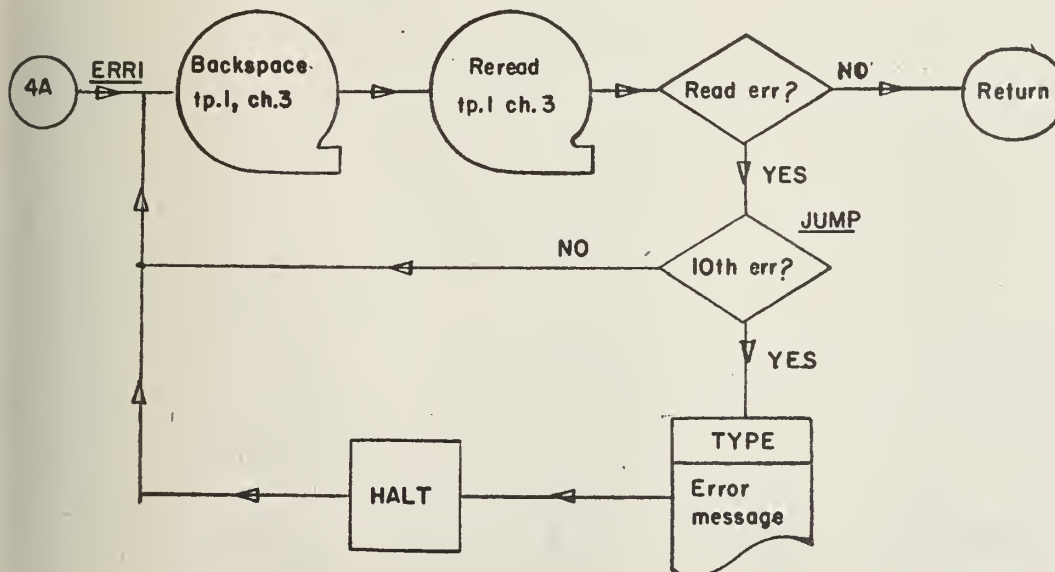

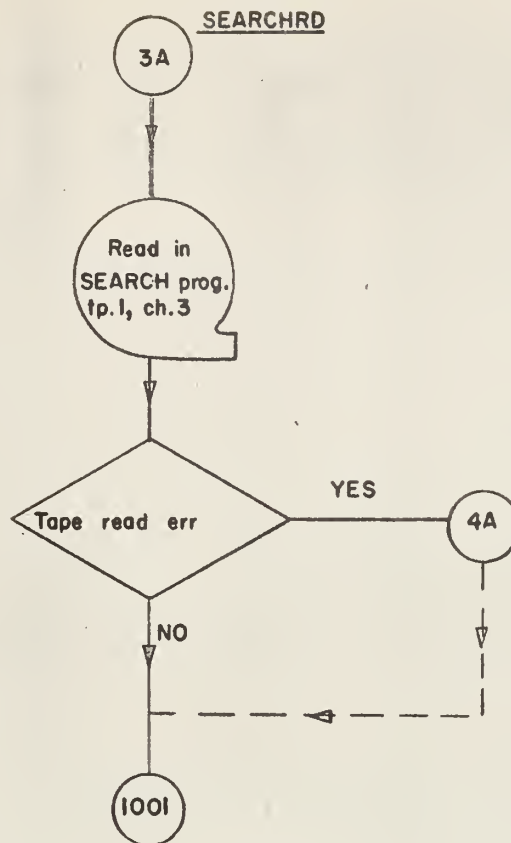

# FLOW CHART OF MASTER CONTROL PROGRAM

## SABIR2 - SEARCH part I (SABIR2 S1)

### I. Paper Tape Input Format for SEARCH part I (Ref. 1, p. 54-55)

#### A. Request record format

The input paper tape should consist only of request records. A request record consists of an identifying tag followed by source, date and uniterm codes in any order. A maximum length of 120 significant characters is allowed and the number of significant characters in the record must be a multiple of eight (See Appendix 1). The record is to be terminated by .. (double period punch).

##### 1. Identifying Tag

- a. The first 8 significant characters of the request record are taken to be the tag which identifies the request.

##### 2. Sources

- a. There may be zero to twelve sources specified.
- b. Each source code must be 8 characters of the form ooxnnnn where x = 1,3,5,7 or 9 and n is any number between 0 and 9.

##### 3. Dates

- a. The date specification consists of 16 characters and is of the form DATExxxxTHRUyyyy where xxxx is the first date and yyyy is the last date of interest.
- b. The 4 digit date is of the form YYMM where YI is the year and MM is the month.

#### 4. Uniterms

- a. 0-12 uniterms may be specified.
- b. Each uniterm is 8 characters in length and of the form ooynnnnn where y = 0,2,4,6, or 8 and n is any number between 0 and 9.

#### B. Error messages (also see Appendix 6)

All error messages on the input format will be printed on the general output tape in the following form:

ERROR "WORD", REQUEST DELETED

where "WORD" is a key word to the type of error and may be the following:

1. UNLISTED - This means an illegal character was found on the input paper tape (see appendix 2 for a list of such char.).
2. TOO LONG - The input record exceeded 120 significant characters.
3. NOT EVEN - The number of characters in the record is not a multiple of 8.
4. 1 WORD - The input record consisted of 1 or less words (groups of 8) and is therefore illegal.

#### II. Arrangement of Requests in memory (1604 core storage) by SABIR2S1.

As the requests are read in, they are converted to BCD and then split up into sections. All the tags are put into one block, the dates in another block, the uniterms another, and the sources in still another.

A. Identifying tags

These are placed sequentially, in the order in which they are read in, into a block called IDENT, each tag occupying one word.

B. Dates

All dates are expanded to 8 characters (leading octal zeros inserted) and BCD zeros are converted to octal zeros (for comparison purposes later).

1. The beginning dates are stored sequentially, in the order in which they are read in, into a block called FRSTDATE, one date per word. If no date has been specified, zeros are inserted for the beginning date.

2. The terminal dates are stored sequentially, in the order in which they are read in, into a block called LASTDATE, one date per word. If no date has been specified for a request, 9999 is used for its terminal date.

C. Source Codes

Each request is designated 13 words for source codes. The first word of the 13 contains the number of source codes for this request followed by the 0-12 source codes. As the requests are read in they are sequentially assigned 13 words in the block named SOURCES.

D. Uniterms

The uniterms for each request are put in a block named UNITERMS in the same manner in which the sources are stored.

### III. Upon entering the SEARCH Part II (SABIR2S2) Routine

- A. The requests are as described in section II.
- B. A latch or word REPEAT has been set to indicate whether to go back and read more paper tape after terminating the Search about to be commenced. (REPEAT is non-zero if more paper tape is to be read)
- C. Current file tapes should already be mounted.
  - 1. DOC 01 should be on unit 2, Ch. 3.
  - 2. ENG 01 should be on unit 3, Ch. 5.
- D. Other tapes needed.
  - 1. SABIR2 SYSTEM tape on unit 1, Ch. 3.
  - 2. Output tape on unit 4, Ch. 6.

### IV. Input magnetic tape formats

See appendix 3.

### V. Actual Search Operation (SABIR2S2)

#### A. Initializes

The labels and first records from the DOC tape and ENG (bibliography) tape are read in. If the bulletin number (accession no.) of the bibliography is less than or equal to the DOC bulletin no. a switch is set so that an ENG record will be read the next time a DOC record is read. This is to keep the ENG tape paced as well as possible with the DOC tape.

#### B. Searching

The program next compares the present DOC record with each of the requests, checking the source, dates and then uniterms of a request to see if there is a match.

1. If a match occurs the present ENG bulletin no. is checked.
  - a. If the ENG accession # is greater than the DOC # then there is no bibliography for this document and only the accession no. plus the request I.D. is moved to the output buffer, OUTPUT. The program then goes to check the rest of the requests.
  - b. If the ENG # is less than the present DOC #, the ENG tape is read in until either V.B.. a. or c. occurs.
  - c. If the ENG # equals the DOC #, then the whole bibliography plus the request I.D. is moved to the output buffer, OUTPUT. The indicator to read ENG next time is set and the program goes back to see if the DOC satisfies any other requests.
2. If no match is found between the current DOC and any of the requests, the next DOC record is brought in and a new ENG record is brought in if necessary. From this point processing continues as explained in section V.B..

## VI. Arranging the Output

When a match has occurred the bibliography is moved to the next available space in the output block.

### A. Size of output block OUTPUT

OUTPUT extends from the end of the program (SABIR2S2) to the end of core. It is subdivided into groups of 84 words, each group accommodating the information for one match between a DOC and a request. The output is stored sequentially in this block, i. e. in the order in which the matches are made.

B. Format of a match's OUTPUT

The 84 words are used as follows:

1. The 1st word contains the requestor's identification word as read in from paper tape in part 1 and stored in IDENT.
2. If there was a bibliography, it is in the next 83 words in exactly the same order it was in on the ENG tape (see appendix 3).
3. If no bibliography was available a word count of three is set in the 2nd word of the 84. A double space control character is moved into the 3rd word of the 84 word group and the accession no. of the bulletin is moved into the 4th word. There is no more output than the above in this case.

C. Upon filling the output buffer OUTPUT

When OUTPUT has been completely filled or when there are no more DOC magnetic tapes, the OUTPUT is sorted and written on tape 4, channel 6 in a format such that the tape may be printed with an IBM 717 or IBM 1401 program using program control.

1. Each requestors identification is compared with the identification of each group of output. If there is any output for the requestor, his identification and the page no. of his output for this printing are printed at the top of a page followed by the accession numbers and bibliographies of his answers. If he has more than 1 page of output, the heading is repeated at the top of each page. (see appendix 5 for sample).

VII. When an END-OF-FILE is encountered on the input magnetic tapes

A. The DOC tapes

A message is printed on the typewriter to put DOC tape no. xx on unit 2, channel 3, or if there are no more DOC tapes to put jump key 3 up (otherwise make sure it is down). The computer then halts to allow mounting of the tape. Upon STARTing.

1. If there are more DOC tapes, the label is checked to make sure this is the correct tape. If it isn't procedure VII. A. is repeated. Otherwise the program continues as described in V.B..
2. If there are no more DOC tapes to be processed, the output buffer is emptied. A check is then made to see if more input paper tape requests are waiting in the paper tape reader.
  - a. If so, a message is typed to remount ENG01 and DOC01 and the computer halts. When START is pressed the program restarts, reading paper tape as described in section II.
  - b. If there are no more requests to process control goes to the Master Control Program for selection of a new SABIR2 option.

B. The ENG tape

A message is typed to mount ENG tape no. xx or set jump key 3 if there are no more ENG tapes.

1. If there are more ENG tapes, the label is checked to see if the proper tape has been mounted. If not the program

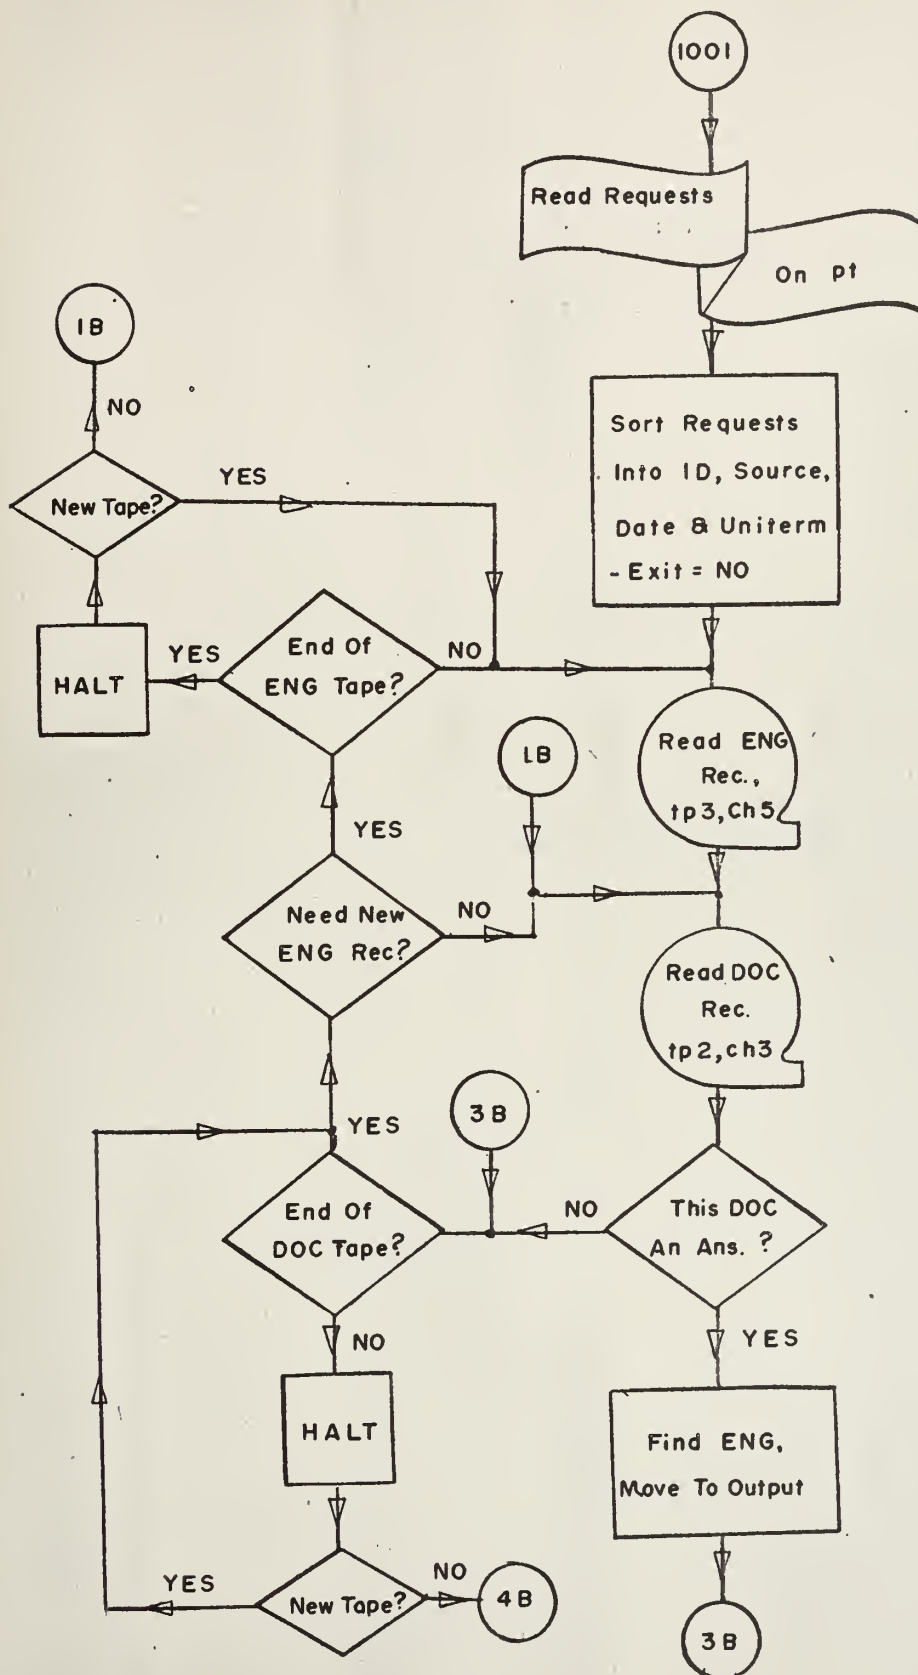

returns to step VII B. If the correct tape has been mounted the program continues from where it left off.

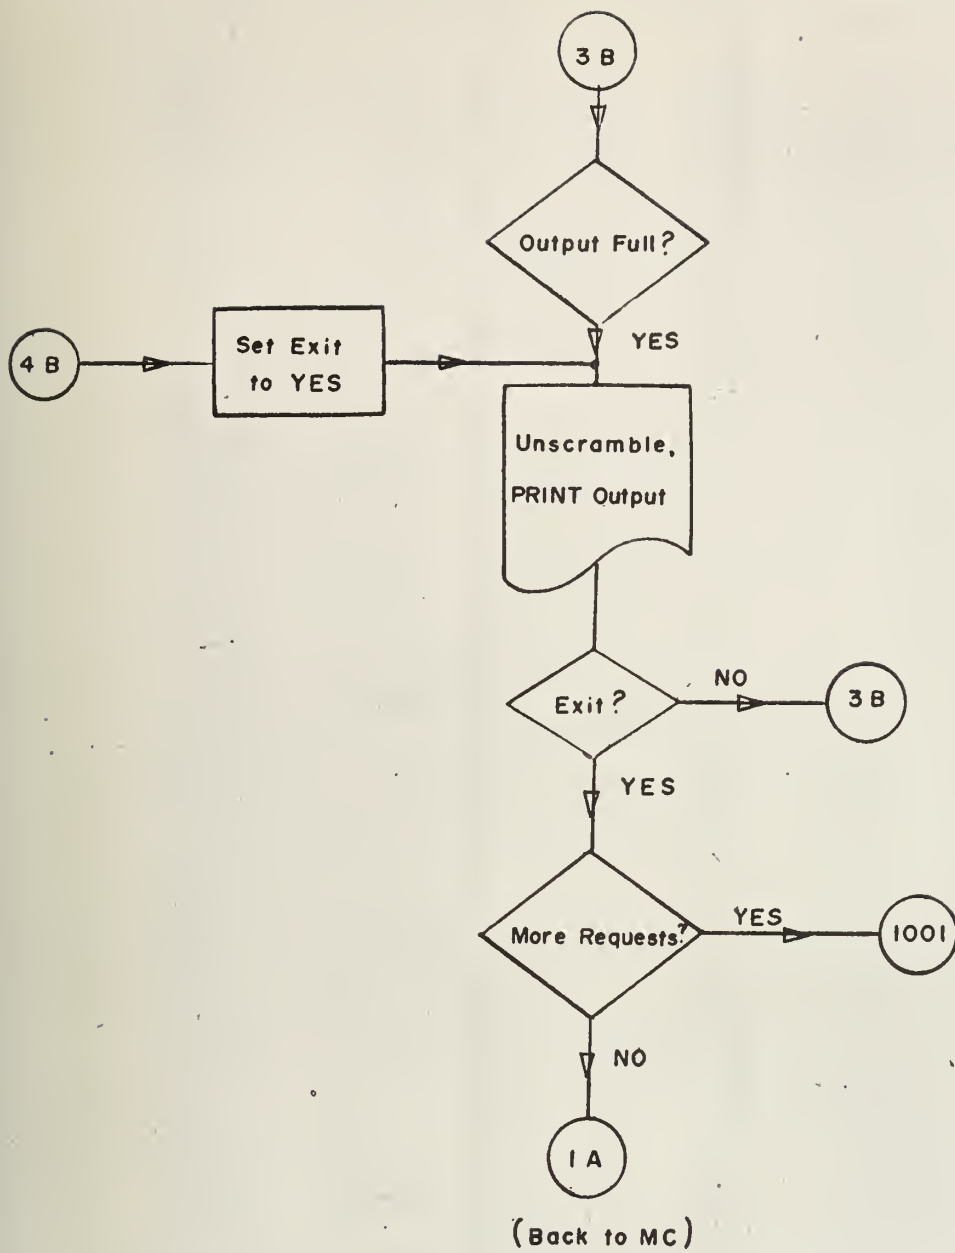

2. If there are no more ENG tapes the current ENG tape no. is set to all nines (this indicates no bibliography for the DOC<sup>0</sup>s being processed) and the program continues from where it left off before.

## SABIR2 - UPDATE

### I. Paper Tape Input Portion

This part of the program reads in the paper tapes to update DOC or ENG magnetic tapes or delete from both tapes.

- A. Paper tapes to update DOC magnetic tapes and/or cause deletions from both ENG and DOC magnetic tapes. The paper tape need not be dated -- if it is the date will be noted as an error and processing will continue. All characters are interpreted as shown in Appendix 1.

#### 1. DOC update records

DOC update records are in the same format as the DOC magnetic tape records. (see Ref. 1, pp. 54-55 and Appendix 5). As they are read in they are sorted into order of ascending accession no. and stored in a block called ADDITION with 15 words devoted to each record. A count of the no. of DOC update records is stored in the cell named ADDCOUNT.

#### 2. Delete records

Delete records have the following format:

- a. The word TODELETE
- b. Followed by up to 14 accession numbers of the form

$$\begin{pmatrix} u \\ s \\ c \\ v \end{pmatrix} \text{ nnnnnnnn where } n \text{ is an integer } 0 \leq n \leq 9.$$

All deletions are sorted into ascending order of accession number (1 deletion per word) and stored in a block named DELETION (BCD zeros and the 1st letter are still present) with the no. of deletions stored in the cell DELETCNT.

## B. Paper Tapes to Update ENG magnetic tapes

If jump key 2 is up (on) the computer will interpret the input paper tape as being a bibliography tape (i.e. ENG update tape). These paper tapes are produced at the same time as the bibliography cards for the library are produced. Each record constitutes the bibliography of one technical document.

1. All information following 2 carriage returns and preceding a .. (EOR) will be considered the bibliography by the program. Any intermediate information will be ignored (see Reference 3).
2. The first word of the record is assumed to be the accession number and of the form

u		u	
s		s	
c	-xx,xxx	c	-xxx,xxx
v		v	

u		x is an integer and
s		
c	-x,xxx,xxx	where
v		

$0 \leq x \leq 9$  and the composite number must have at least 5 significant digits.

3. The bibliography information is read in and the characters translated according to Appendix 2. It is then arranged into line images of 120 characters (15 words) per line, each line

preceded by a 1 word (8 char.) control for printing.

a. Word 1 - binary word count of bibliography

b. Word 2 - print control word ' obbbbbbb

c. Word 3 - the accession no. Lnnnnnn

where L = U, S, C, V

n = 0, 1, 2, 3, 4, 5, 6, 7, 8, 9

d. Word 4 - control bbbbbbb

e. Word 5 - 19 1 line of bibliography

f. Word 20 - bbbbbbb

g. Word 21 - 35 line 2 of bibliography

etc.

4. They are then sorted into order of ascending accession no.  
and stored in blocks of 83 words per bibliography record in a  
block named ENGLISH and the no. of bibliographies is stored  
in the cell called ENGCOUNT.

## II. Initialization to Update

A. External - magnetic tapes necessary. All 6 tapes are necessary if  
deleting. If only updating the DOC tape, the ENG tapes may be  
omitted and if only updating ENG tapes, the DOC tapes may be  
omitted.

1. System tape - unit 1, Ch. 3-4

2. Current DOC input tape - unit 2, Ch. 3-4

(usually start with DOC 01)

3. Blank tape - unit 3, Ch. 3-4

(on which to generate a new ENG tape, if updating the ENG tapes)

4. Current ENG tape - unit 3, Ch. 5-6
5. Blank tape - unit 2, Ch. 5-6  
(on which to generate new DOC tape)
6. Blank tape - unit 4, Ch. 5-6  
(for output listing of addition and deletions)

B. Internally

If Deletions are requested, switches ENGSWITC and DOCSWITC are set on (to - 1) to indicate that both DOC and ENG magnetic tapes need to be altered. Otherwise the ENGCOUNT and ADDCOUNT are tested and the switches are set on if updating is to be done and off (to zero) if updating is not to be done to the ENG and DOC tapes respectively.

### III. Processing

- A. If both DOC and ENG updating or deleting are necessary the program alternately reads in a DOC tape record, checks if it is to be updated or deleted, then does the same for an ENG tape record.
1. If the tape record is to be updated, the new record is inserted in the proper place on the updated tape or replaces a record on the tape.
  2. If it is to be deleted then the record is not copied on the new current file being created.
  3. If the end of either input tape is reached or the end of an output tape, messages are typed and the program waits for a new tape to be mounted. When there are no more input tapes of one kind, processing continues as described in section

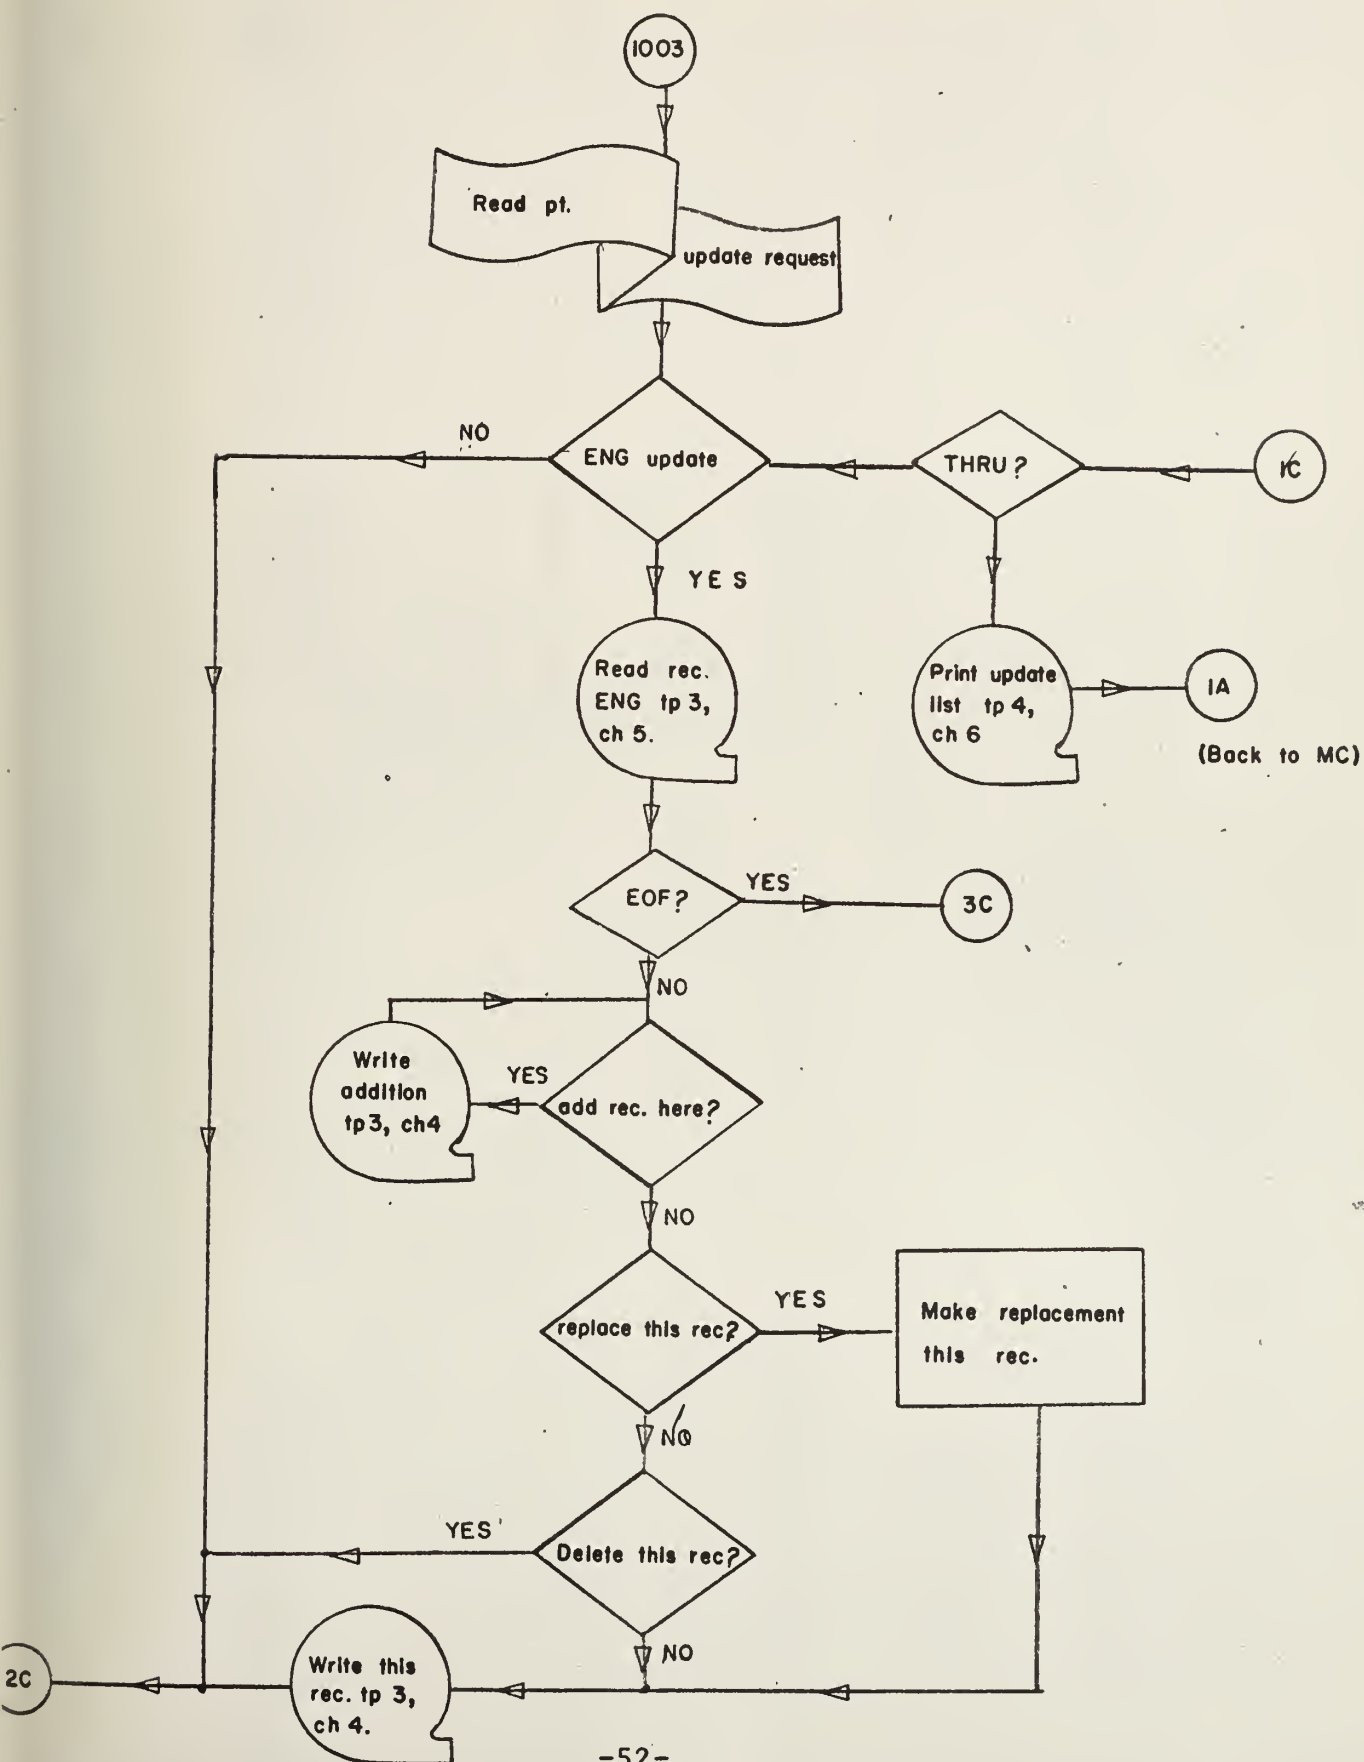

III B for updating only 1 type of tape.

- B. Updating just ENG or just DOC, the program proceeds as in III A but the switch is set off which controls reading 2 types of tape, so only one type is read in and only 1 type of new current file is created.
- C. No more input tapes

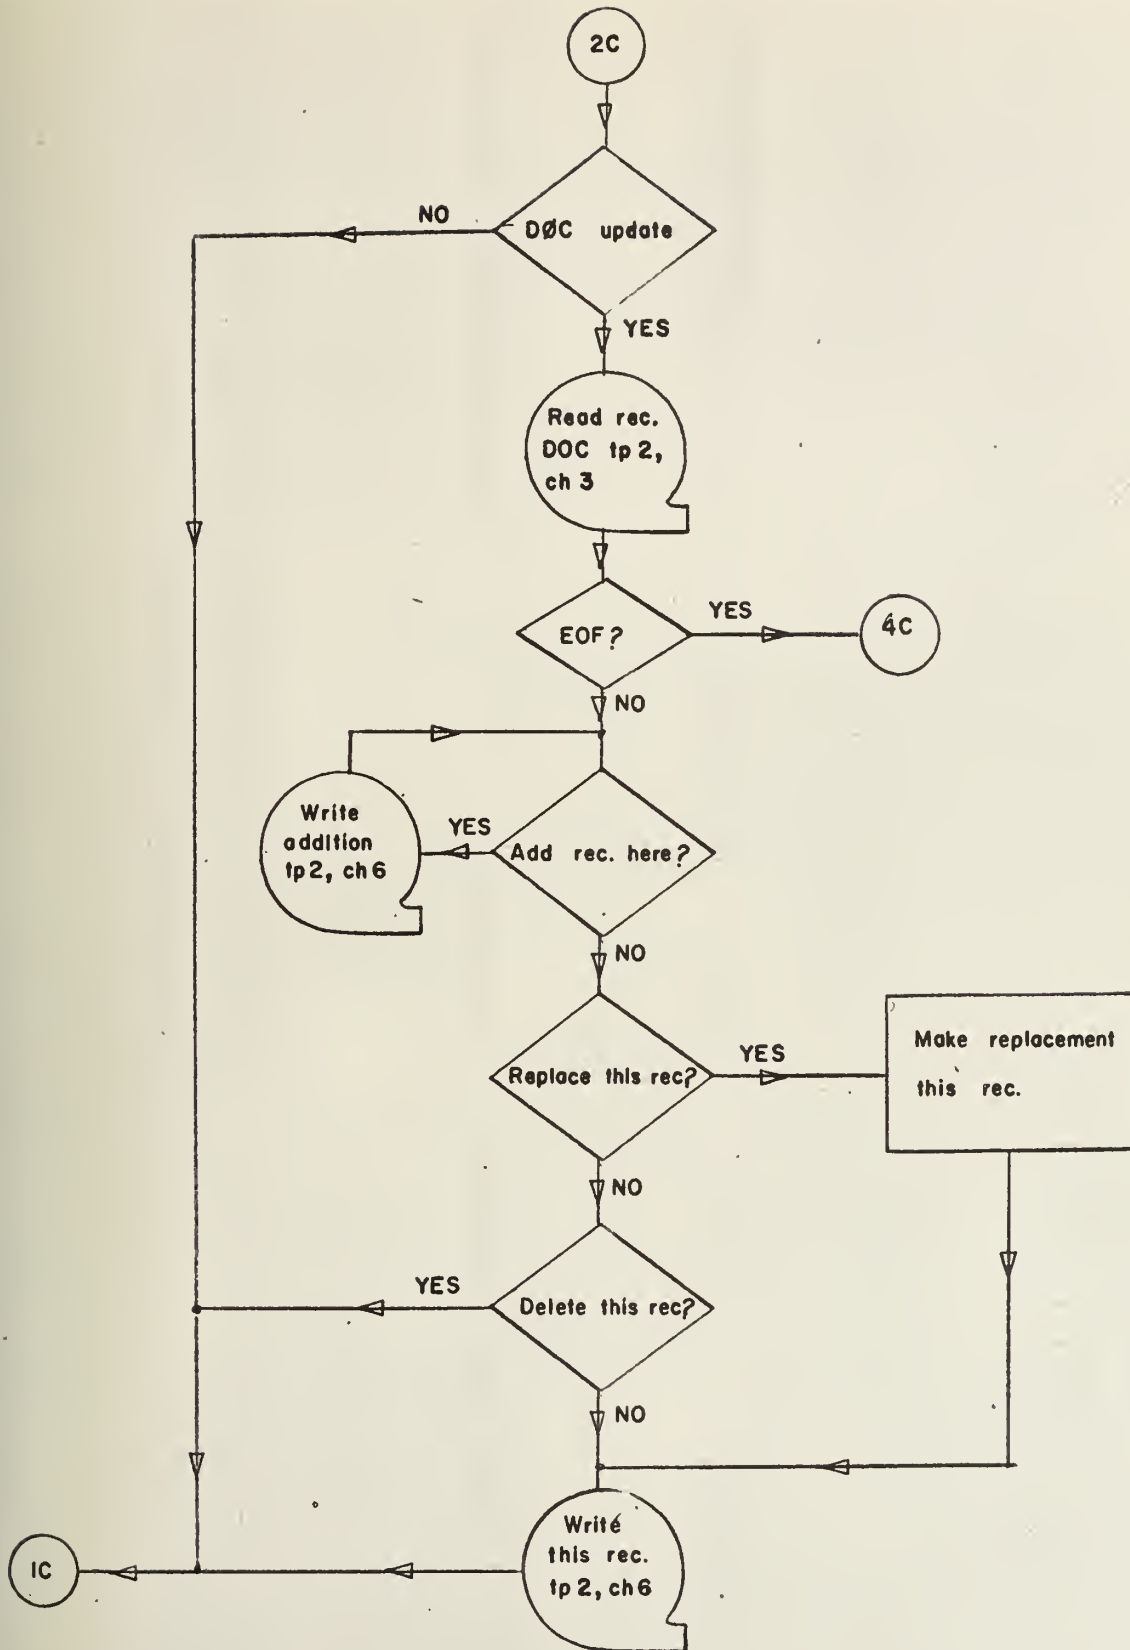

When there are no more input tapes of either kind, all additions not yet added are added and a list of all additions and deletions is printed on the printable output tape, unit 4, Ch. 6. An EOF is placed at the end of the output tapes.

## APPENDIX 3

### Magnetic Tape\* Formats

#### 1. System tape (unit 1 Ch. 3-4)

##### a. Generating the system tape

##### 1. Arrange binary program decks as follows

- a) Bootstrap card (obtained from SCRAP assembled SABIR2BT binary deck with the 1st 2 binary ID cards removed and the binary TRA card removed; (see Reference 4).)
- b) SABIR2LD (obtained from SCRAP assembled SABIR2LD binary deck by removing 1st 2 binary ID cards.)
- c) SABIR2WR (SCRAP absolute binary deck with octal correctors as necessary.)
- d) SABIR2MC (SCRAP absolute binary deck with octal correctors as necessary.)
- e) SABIR2S1 (SCRAP absolute binary deck with octal correctors.)
- f) SABIR2S2 (SCRAP absolute binary deck with octal correctors)
- g) SABIR2UP (SCRAP absolute binary deck with octal correctors)

##### 2. Put these cards on magnetic tape using 1401 program

A1:CT01 or 168 ch/bin. rec. and 88 ch/BCD rec.

\*CAUTION: All tapes must have EOT reflective marks.

3. Place this magnetic tape on unit 1, Ch. 5-6 of the 1604.
4. Place a system tape on unit 1, Ch. 3-4 of 1604.
5. BOOTSTRAP using the following:

```

00010 in A reg. right
200 00005 in FC & EA -- STEP
740 52011 in FC & EA -- STEP
745 00000 in FC & EA -- STEP

-- CLEAR

put 00006 in PAR -- START

```

6. A SABIR2 system tape will be generated on unit 1, Ch. 3-4 and should be file protected.

b. Error stops in generating the System tape

<u>PAR</u>	<u>REASON</u>
77563	Checksum error - press start to retry
77602	Tape read error unit 1, Ch. 5. Press start to retry.
77747	Tape write error unit 1, Ch. 4. Press start to retry.

c. Composition of the System tape

1. Rec. 1 - binary record of the Master control system i. e. SABIR2MC
2. Rec. 2 - binary record of Search program - part 1 i. e. SABIR2S1
3. Rec. 3 - binary record of Search program - part 2 i. e. SABIR2S2
4. Rec. 4 - binary record of Update program i. e. SABIR2UP

d. Using the System tape - see operating instructions.

## 2. DOC tapes

- a. The first record consists of 32 BCD characters comprising the tape label.

1. The first 8 characters are the tape name and number

DOCbbb<sup>\*</sup>xx

where xx is a 2 digit tape number which is the sequence no. of the tape in the multi-reel file.

2. The next 8 characters (9-16) are of the form

byyyyyyy

where yyyyyyy is the accession no. of the first bulletin on the tape.

3. Characters 17-24 comprise the date in the following form

mm/dd/yy

where mm = 01, 02, ..., 12 the month,

dd = 01, 02, ..., 31 the day,

and yy = 01, 02, ..., 99 the year.

4. Characters 25-32 may be any BCD characters and at present are blank.

- b. All following records consist of 120 characters having the following format.

1. Char. 1-8, the accession no. of the technical bulletin.

2. Char. 9-16, source no. of the bulletin which is of the form

ooxnnnnn where x is an odd integer

$1 \leq x \leq 9$  and n is any integer  $0 \leq n \leq 9$ .

\* small b means blank.

3. Characters 17-24 are the date of publication of the documents and is in the form ooooyymm where yy is the year and mm is the month.

4. Characters 24-120 are the uniterm numbers for the document, each consecutive 8 char. group comprising a uniterm and being of the form ooYnnnnn where Y is an even integer  $0 \leq Y \leq 8$  and n is any integer  $0 \leq n \leq 9$ .

a) If there are not 12 uniterms for a document the end of the record will be filled with BCD blanks.

c. The tape is terminated with an End-of-file mark.

### 3. ENG tapes (bibliographies)

a. The first record consists of a 32 character BCD label record of the same format as the DOC tapes first record with the exception that the first 3 characters of the record are ENG.

b. All following records are variable length ( a max. of 83, 1604 words) and in the binary mode.

1. The first word of the record contains the word count for the record.

2. All following words were BCD internally to the 1604 but were written on tape in the binary mode.

a) The second word of the record contains

obbbbbbb

b) The third word contains the accession no. of the document.

c) The fourth word contains blanks.

d) Thereafter there are 15 words of bibliography information followed by a blank word, 15 words and a blank up to the last group which may have 0-15 words and is followed by EOR gap.

c. The tape is terminated by an END-OF-FILE mark.

d. This tape may be printed on the IBM 1401 using program A8:  
PRNTENG01 (see Appendix 8).

4. The output tape (unit 4, Ch. 6)

Format varies depending upon the nature of the run. The tape is written in BCD and terminates with three lines of "END-OF-TAPE, END-OF-TAPE, END-OF-TAPE." and an EOF which are put on the tape by the operator's selection of the END. option.

APPENDIX 4

3. Sample UPDATE paper tape input for ENG update.

U-77,709

Aerospace Research Laboratories.

ARL-63-140.

Nature of the interaction between electrons and well-defined surfaces. II. Interaction between a small cross-section helical electron beam and uniform electrical fields perpendicular to the helical axis, by A. G. Jackson and E. L. Kern. August 1963. 49 p."

U-77,710

Army Missile Command.

Report RG-TR-63-25.

Design and development of flat cable electrical connectors, by Charles E. Riley and Kenneth W. Plunkett. 5 September 1963. 63 p."

U-77,711

Oak Ridge National Laboratory.

ORNL-2800.

Activity release from the W. J. Savannah in the maximum credible accident, by T. D. Andersen and others. 16 October 1963. 112 p."

U-77,712

Army Personnel Research Office.

TRN-132.

Successive AFQT forms - - comparisons and evaluations, by A. G. Bayroff. May 1963. 18 p."

U-77,713

Aerospace Research Laboratories.

ARL 63-174.

Simultaneous tests and the efficiency of generalized balanced incomplete block designs, by P. R. Krishnaiah. October 1963. 93 p."

U-77,714

Los Alamos Scientific Laboratory.

LAMS-2960.

Implicit radiation diffusion, by Robert N. Thorn and Burton Wendroff. 15 August 1963. 26 p."

U-77,715

Microwave Research Institute.

PIBMRI-1151-63.

Leaky wave radiation from a periodically slotted waveguide, by Jean-Paul Renault. 8 May 1963. 16 p."

## APPENDIX 6

### Error Messages

#### I. SEARCH Program

##### A. On the typewriter

1.   MODE           - Means paper tape reader is not in the character mode.
2.   50 REQST       - Maximum no. of requests read in; they will be processed and then the computer will read in the rest of the requests and process them.
3.   TOO MANY       - Next tape no. is 100 which is too large. Nothing can be done.
4.   TAPE 2         - Error in reading DOC input tape 2, Ch. 3. Press start to retry reading it.
5.   TAPE 7         - Error in reading ENG input tp. 3, Ch. 5-6. Press start to retry.
6.   TAPE 8         - Error in writing on output tape 4, Ch. 5-6. The program continues without halting.

##### B. Printed on output tape

The following message is printed

ERROR XXXXXXXXX, REQUEST DELETED

where XXXXXXXXX can be any of the following words.

1.   NOT EVEN       - The input request is not a multiple of 8 char. and will be ignored.
2.   1 WORD         - One word request, ignored.

3. UNLISTED - Illegal character on input paper tape.
4. TOOLONG - Input request more than 120 characters.

## II. Update program

### A. Typewriter

1. MODE - Paper tape reader is not in the character mode.
2. FULL - One of the 3 input areas (DOC additions, ENG additions or deletions) is full i. e. contains 250. They will now be processed.
3. WRONG TP - Wrong input tape mounted, mount the one requested by the typewriter message.
4. TOO MANY - Input tape #100 required, too much for program to handle.
5. TAPE 2 - Error in reading DOC input tape, unit 2, Ch. 3-4.  
Press start to try again.
6. TAPE 3 - Error in writing ENG output tape, unit 3, Ch. 3-4.  
Press start to try again.
7. TAPE 6 - Error in writing DOC output tape, unit 2, Ch. 5-6.  
Press start to retry.
8. TAPE 7 - Error in reading ENG input tape, unit 3, Ch. 5-6.  
Press start to retry.
9. TAPE 8 - Error in writing on output tape, unit 4, Ch. 5-6.

### B. Printed on output tape.

The following message will be printed

XXXXXXXX, UPDATE REQUEST DELETED

where XXXXXXXX can be any of the following.

1. E. INPUT - Can't decipher accession number of bibliography paper tape input so record ignored.
2. FORMAT - Bibliography, deletes or DOC addition incorrect, it will be skipped.
3. TOO BIG - English (bibliography) input too long.
4. TOOLONG - DOC input record too long.
5. UNLISTED - Illegal character in paper tape input.
6. NOTEVEN - DOC or delete paper tape input is not the correct length. i. e. is not a multiple of 8 characters.

## APPENDIX 8

### 1401 Program Brief

CLASS: A8	IBM NO: None
NAME: PRTENG01	SOURCE: USNPGS
DATE: 7 Jan 1964	C. Haworth

#### 1. USAGE:

To print ENG tapes generated by the USNPGS Library's SABIR2 system.

#### 2. FEATURES:

Prints the binary tape as if it were BCD inserting BCD blanks where necessary. First record of input tape is assumed to be BCD label.

For more information on the format of the tape printed see Appendix 3 of the SABIR2 system's documentation.

#### 3. OPERATING INSTRUCTIONS:

- a. Place ENG tape on unit 1, low density.
- b. Ready printer with 11 inch paper.
- c. Place the program object deck in the card read hopper.
- d. Reset 1401, press card load.
- e. After printing to an EOF the program will halt with 0782 in the I address register.
- f. To print another file on the same tape press start.

#### 4. ERROR STOPS:

##### I REG

##### REASON

0738	Tape label (first record on tape) is in error. Rewind tape and press start to try again.
------	--

0759	Tape label error. Press start to try again.
------	---

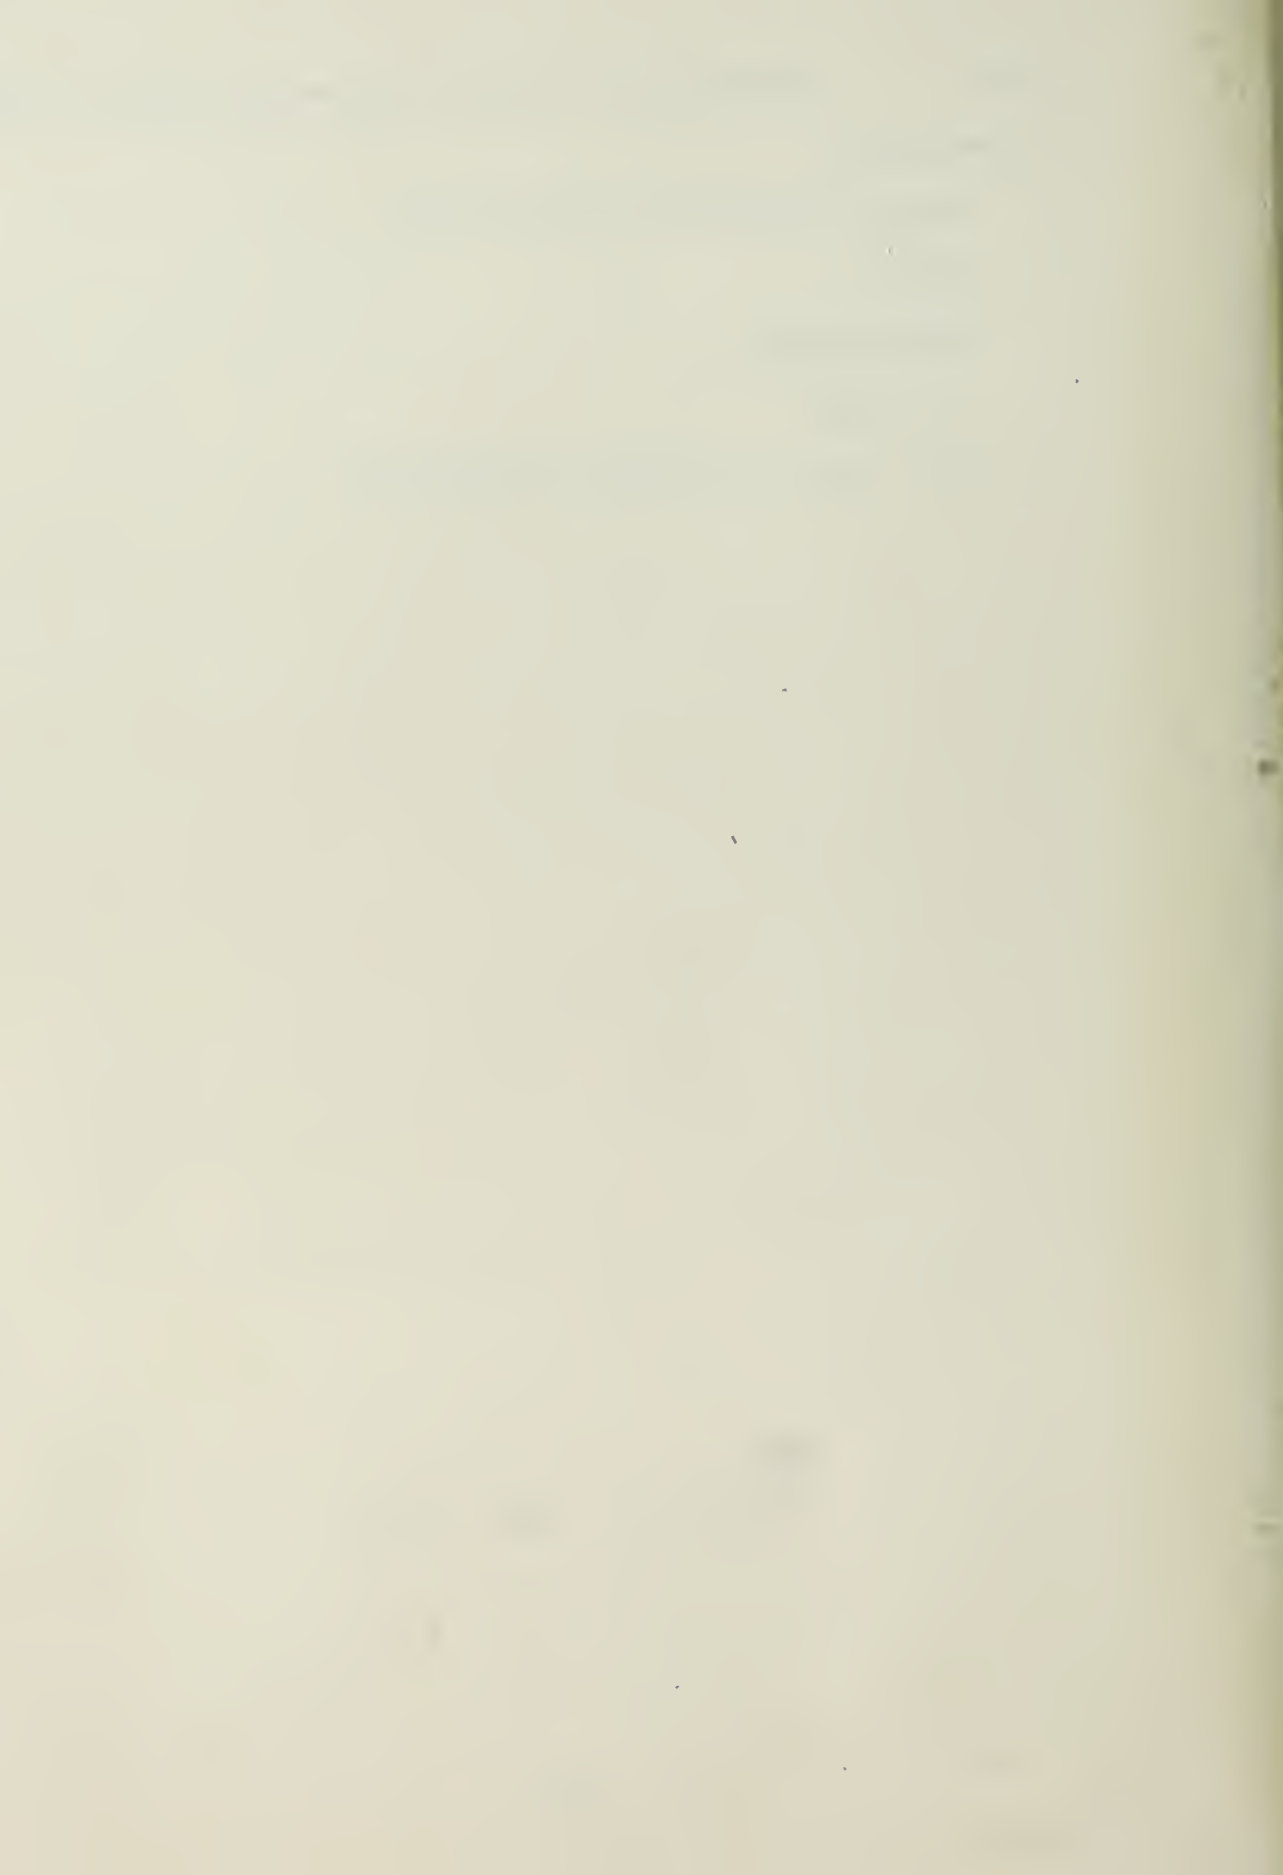

0879

Tape read error. Rewind tape and press start to retry.

5. DOCUMENTATION:

- a. Write-up (this brief is the write-up)
- b. Flowchart
- c. Program listing
- d. Source deck
- e. Object decks (One-for-One and Condensed).
